

Taggar

Man kan tilldela en funktion taggar. Ex:

```
- name: Configure dot1q interfaces
  cisco.ios.ios_l2_interfaces:
    config:
      - name: "{{ item.name }}"
        mode: trunk
        trunk:
          native_vlan: "{{ native_vlan }}"
          allowed_vlans: "{{ access_vlans }}"
        state: replaced
    loop: "{{ trunk_interfaces }}"
    when: trunk_interfaces is defined
  tags:
    - vlan
    - trunk
```

När man sen kör ansible med en tagg gör man det genom: `ansible-playbook -main.yml -t vlan,svi`

Kommatecknet mellan taggarna i kommandot ovan gör att man matchar flera taggar.
